

# CLAIMS

1 1. A method for balancing printing request loads, comprising:  
 2 receiving printing request data that corresponds to a printing request at  
 3 a primary destination;  
 4 selecting a secondary destination to process the printing request; and  
 5 transmitting print queue data to the secondary destination, the print  
 6 queue data including information corresponding to the printing request.

1 2. The method of claim 1, wherein:  
 2 receiving comprises receiving multiple print request data that  
 3 corresponds to multiple print requests at the primary destination; and  
 4 transmitting comprises transmitting print request data that corresponds  
 5 to at least one of the print requests to the secondary destination.

1 3. The method of claim 1, wherein the printing request data is received from a  
 2 source; and further comprising:  
 3 transmitting secondary print destination data to the source, the  
 4 secondary print destination data including information corresponding to the  
 5 secondary destination.

1 4. The method of claim 1, wherein selecting further includes:  
 2 communicating with the secondary destination; and  
 3 determining if the secondary destination is able to process the printing  
 4 request.

1 5. The method of claim 3, further comprising:  
 2 creating the print queue data; and  
 3 creating the secondary print destination data.

10039198, 010406

1 6. The method of claim 1, further comprising:  
 2 receiving the printing request from a source; and  
 3 transmitting secondary print destination data indicating that the source  
 4 is to transmit information corresponding to a print task to the secondary  
 5 destination.

1 7. The method of claim 4, further comprising:  
 2 determining if the secondary destination is able to continue processing  
 3 additional printing requests.

1 8. The method of claim 1, further comprising:  
 2 sending the information corresponding to the print task to the  
 3 secondary destination.

1 9. The method of claim 1, further comprising:  
 2 receiving the print queue data; and  
 3 receiving information corresponding to a print task.

10039498-010402

1 10. A system for load-balancing comprising:  
 2 a primary print server configured to:  
 3 receive printing request data corresponding to a printing request;  
 4 determine if the primary print server is able to process the printing request data;  
 5 communicatively couple with another print server;  
 6 transmit print queue data to another print server; and  
 7 transmit secondary print destination data to the source of the primary request  
 8 data indicating that the source is to transmit the information corresponding to the print  
 9 task to another print server.

1 11. The system of claim 10, further comprising:  
 2 a source of a printing request for a printing task.

1 12. The system of claim 10, further comprising:  
 2 a secondary print server communicatively coupled to the primary print server, a  
 3 secondary print server system configured to receive the print queue data, and wherein  
 4 the secondary print server is configured to receive information corresponding to the  
 5 print task.

1 13. The system of claim 12, wherein the primary print server is configured to  
 2 determine if the secondary print server is able to process the printing request data.

1 14. The system of claim 10, wherein the primary print server is configured to  
 2 produce the print queue data and the secondary print destination data.

1 15. The system of claim 12, wherein the secondary print destination data indicates  
 2 that the source is to transmit information corresponding to the print task to the  
 3 secondary print server.

204070-030400

1 16. The system of claim 10, wherein the primary print server includes:  
 2 means for receiving printing request data that corresponds to the  
 3 printing request from a source;  
 4 means for selecting a secondary print server to process the printing  
 5 request;  
 6 means for transmitting the print queue data to the secondary print  
 7 server, the print queue data including information corresponding to the printing  
 8 request; and  
 9 means for transmitting the secondary print destination data to the  
 10 source, the secondary print destination data including information  
 11 corresponding to the secondary destination print server.

1 17. The system of claim 12, wherein the secondary print server includes:  
 2 means for receiving print queue data; and  
 3 means for receiving secondary print destination data.

1 18. A computer readable medium for use in a computer system for balancing  
 2 printing request loads, said computer readable medium comprising:  
 3 logic configured to enable printing request data that corresponds to a  
 4 printing request from a source to be received by a first destination;  
 5 logic configured to enable a secondary destination to be selected,  
 6 wherein the secondary destination processes the printing request; and  
 7 logic configured to enable print queue data to be transmitted to the  
 8 secondary destination, wherein the print queue data includes information  
 9 corresponding to the printing request.

1 19. The computer readable medium of claim 18, further comprising:  
 2 logic configured to enable secondary print destination data to be  
 3 transmitted to the source, the secondary print destination data including  
 4 information corresponding to the secondary destination.

- 1 20. The computer readable medium of claim 19, further comprising:  
 2 logic configured to enable the print queue data to be created; and  
 3 logic configured to enable the secondary print destination data to be  
 4 created.
- 1 21. The computer readable medium of claim 18, further comprising:  
 2 logic configured to enable the print queue data to be received; and  
 3 logic configured to enable information corresponding to a print task to  
 4 be received.
- 1 22. The computer readable medium of claim 18, wherein:  
 2 logic configured to enable printing request data that corresponds to a  
 3 printing request from a source to be received by a first destination further  
 4 comprising logic configured to enable multiple print request data that  
 5 corresponds to multiple print requests to be received at the primary destination;  
 6 and  
 7 logic configured to enable print queue data to be transmitted to the  
 8 secondary destination further comprising logic configured to enable print  
 9 request data that corresponds to at least one of the print requests to be  
 10 transmitted to the secondary destination.
- 1 23. The computer readable medium of claim 18, wherein logic configured to enable  
 2 a secondary destination to be selected further comprising:  
 3 logic configured to enable communication with the secondary  
 4 destination; and  
 5 logic configured to enable the secondary destination to determine if it is  
 6 able to process the printing request.
- 1 24. The computer readable medium of claim 23, further comprising:  
 2 logic configured to enable the secondary destination to determine if it is  
 3 able to continue processing additional printing requests.

- 1 25. The computer readable medium of claim 18, further comprising:  
2 logic configured to enable the printing request from a source to be  
3 received; and  
4 logic configured to enable the secondary print destination data  
5 indicating that the source is to transmit information corresponding to a print  
6 task to the secondary destination to be transmitted.
- 1 26. The computer readable medium of claim 18, further comprising:  
2 logic configured to enable the information corresponding to the print  
3 task to be sent to the secondary destination.
